## Options

**NOF:** This feature allows for customizing output circuit breakers for power needs only in cases of emergency (i.e. exiting lighting or evacuation power). In the event of an AC power outage, the fixtures, lamps and/or loads connected to the emergency circuit(s) will immediately begin operating at full-light output.

**NOH:** Outputs are basically the same as the Normally Off Circuit (NOF) option. Both are excellent options when the customization need is to provide power only in cases of emergency (i.e. exiting lighting or evacuation power). The difference between the two is that the NOH feature allows the emergency circuit (up to 10 minutes) to remain energized after the utility power is re-stored. This means that in the event of an AC power outage, the fixtures, lamps and/or loads connected to the emergency circuit (s) will immediately begin operating at full-light output for a maximum of 90 minutes. When utility power is restored, the emergency circuit (s) will stay energized for up to 10 minutes (depending on user setting). At the end of the pre-set time, the normally-off circuit (s) will shut off OCB—Output Circuit Breaker(s).

**OCB:** Standard output circuit breaker(s) for separating and controlling the load connected to the ELI.

**EPO:** Provides the user the ability to instantly turn the UPS off without having to throw the breakers. The EPO option is primarily used as a personnel safety feature that will shut off all power to the ELI output and load. When pressed the input utility power is still on the terminal block, but the microprocessor turns the inverter and rectifier off.

**EMB:** Manual Bypass Switch: A manual make before break inter-

nal bypass switch is provided to isolate the ELI inverter output, static bypass and connected load directly to the utility.

**RMP:** Enables the user to remotely monitor the ELI. Through the use of relays, the RMP allows the user to know if the ELI is operating on the input utility power, battery or if the ELI's output is "On" or "Off".

**SNMP:** Internet standard protocol for managing devices on IP networks." Devices that typically support SNMP include routers, switches, servers, workstations, printers, modem racks, and more. It is used mostly in network Management systems to monitor network-attached devices for conditions that warrant administrative attention.

The SNMP will be able to send emails to interested parties when a problem with the power supply occurs. The SNMP will host a java webpage that shows all the relevant voltages, currents, powers, energies, times, alarms, associated with the power supply. The operator will also be able to remotely operate the power supply as if they are standing in front of it pushing buttons.

**FCC:** The ELI is capable of providing optional relay contacts. The contacts will be a form "C" contact and will change state to indicate the operating status. The contacts will be rated at 2.0 A (125 VAC / 30 VDC).

**CAB:** The ELI and any accessory cabinet(s) are available with a NEMA type enclosure (NEMA 12, 3R, 4X) to include AC cooling.

**SRB/SRM/WMB:** Brackets for securing units in seismic areas.
